AI-Assisted Development - Exam

Overview

You will create a Google Drive Document describing a small software project that you built using GitHub Copilot, Claude Code, Augment Code, Cursor, or a combination of these tools.

Choose Your Own Project Topic

Select any small software system (script, automation, API, mini-app, CLI tool, etc.).
Describe the idea and the system requirements in **up to 1 page**.

System Architecture – Modules

Use AI to break the system down into several **technological modules** (e.g., authentication, data processing, UI, database layer, automation step, testing layer, etc.).

For each module, you will describe your approach and how AI assisted you.

Development Process per Module

For every module, include:

- **Approach & reasoning** – how you planned the solution
- **Step-by-step workflow** – what you asked the tool to generate or modify
- **Testing strategy** – how you validated correctness
- **AI tool choice** – which tool you used (Copilot, Claude Code, Augment, Cursor, etc.) and why
- Key prompts or interactions (2–3 examples are enough)

Keep the description for each module **up to half a page**.

Challenges & Tool Comparison

A section where you explain:

- The **biggest challenges** you encountered
- Which tool helped you the most and **why**
- What you would improve if you continued working on the project

Working System Evidence

Include at least two screenshots of the functioning system.

This can be the terminal, UI, logs, Postman result, or anything that proves the implementation works.

Repository

In the document provide a link to your **GitHub repository** containing the source code.

Submission Format

Link to Google Drive Document (make sure it is shared – anyone with the link can view)

Total size: typically 3-6 pages
